

Report and Evidence for P.E. School Sports Funding

April 2017 - 2018

This year has been another successful year for Christ Church School in regards to sport and P.E. We feel we have wisely spent our P.E. grant money, promoting P.E. and healthy lifestyles to our children and seeing, within the evidence, the positive impact this is having on our school.

The Amount of Premium Received

This year we have seen an increase in our P.E. grant funding. We now receive £18,000 to promote sport and P.E. in our school. You can see a breakdown of how this has been spent on our website. It is important that we spend the money in a sustainable way, our main focus is to develop the skills of the staff and encourage all children to be aware and responsible for their health. Please follow this link to see how this has been spent.

How the Improvements will be Sustainable in the Future

Our aim is that the P.E. grant money leaves a lasting legacy on our staff and children. We have invested money in upskilling our staff, from teachers and LSAs to lunch time supervisors and volunteers. We are hoping to invest more of this money over the coming years into our facilities, allowing more access to outside sport.

Data

We can confidently say that all the children in our school are physically active for at least 30 minutes a day. All the children and staff take part in the daily mile 3 days a week. This accounts for 15 minutes of physical activity. On the days the daily mile does not take place, classes do a wake and shake activity to show children how to be physically active even in doors. Our lunch times are structured with a number of different physical activities going on. This then can account to 30 mins also. SEN children who may take part in a 20:20:20 structured lunch will always take part in some form of physical activity daily and also take part in wake and shake and daily mile. We are very proud of how active our children are on a daily basis.

Our school nurse weighed our year 6 children as part of their routine assessments. The results showed our children had a lower than average obesity rate. This was great news for us as it showed all our effort in supporting children and parents with living healthy lifestyles had worked well.
